**Learner Mode – UI/UX Improvements & Development Requirements**

**1. Training**

**A. Programs**

- **Simplify headings and subtext:** Remove references to "Curriculum" and "Pathways" and replace descriptive subtext with clear, action-oriented guidance. Apply this consistently across all sections. The navigation bar already provides context.
- **Reduce dashboard space:** Display the enrolled program count in a small circular badge next to "Your Programs."
- **Simplify Curriculum Cases:**
    - Remove keyword tags from the user-facing UI (retain them internally).
    - Remove redundant buttons such as "Attempted," "Unattempted," and "Plan Case" if they lead to the same page. Use one clear action instead.

**B. Sessions**

- Apply the same heading, subtext, and compact dashboard improvements as Programs.
- Clarify what data will be displayed under "Preview Data."
- Update the TKR steps sequence within the cases to reflect the latest workflow.
- Improve navigation within sessions:
    - Provide clear navigation between the case, planning page, and session.
    - Add "Back to Case" and "Open Plan" options within the case/session interface.
- **Separate Views and Reports:** Clearly distinguish between opening a session, viewing a case, and accessing a report from the Programs page.
- Fix the inconsistency where only two completed Training Mode sessions appear in the list, while other reports are accessible through cases in Programs. Ensure sessions and reports are correctly linked and consistently displayed.
- Revise the report structure for VR Dep.

**2. Content Library**

**A. Procedures**

- Remove the separate "Cases" button within Procedures if the Case Library is accessible from the side navigation.
- Fix the "View Cases" action so it opens the relevant case management view rather than redirecting to the same TKR page.
- **Restructure the page:** Display procedures as expandable sections, with their associated case cards underneath.
- Show case metadata directly on each card using labels such as pathology, side, difficulty, and number of attempts.
- Avoid maintaining a separate Case Library page if cases can be managed directly within Procedures.

**B. Pre-op Plans**

- Fix the page so it accurately reflects the cases available in the system.
- Instead of a separate Pre-op Planning page, allow users to enter planning mode directly and navigate between cases.
- Display the selected case's plans, attempts, sessions, and reports compactly within the same interface.
- Remove user-facing keyword labels while retaining them internally.
- Reduce the size of the dashboard within the case planning card.

**Standardise the case planning page layout in this order:**

1. Case name
2. Short case description (one paragraph)

3. Patient details
4. Scans
5. Scoring
6. Plans / Attempts

Remove Learning Objectives and eliminate the current scattered, collage-like layout.

**C. Planning Page**

- Design the page to fit within a single screen without requiring scrolling, where feasible.
- Prioritise compact spacing and clear information hierarchy.

**D. Case Creation**

- Add an **"Add Case"** button directly within the Procedures page.
- Open the complete case creation workflow in a dialog/modal instead of navigating to a separate page.
- Keep the workflow simple and contained within the same interface.

**Expected user flow:**

Procedures → Expandable case cards with metadata → Case planning/details → Plans and attempts.

**3. Progress**

Consolidate the following into a single Progress page:

- Overview
- Activity
- Reports
- Ensure users can access their progress information without navigating across multiple separate pages.
- Update "By Skill" reporting so it is not limited to TKR. Skill-based reporting should be general and support all relevant procedures and training activities.

**4. Performance**

- Investigate why the application reloads or loads excessive content on every navigation.
- Reduce unnecessary API calls, repeated data fetching, and full-page reloads.
- Cache or reuse data where appropriate and load only the content required for the current view.

**Priority Summary**

1. **Navigation and information architecture:** Fix broken links, clarify the relationship between Programs, Cases, Planning, Sessions, and Reports.
2. **Page structure:** Simplify Procedures, Pre-op Plans, and Progress into a more intuitive workflow.
3. **UI cleanup:** Remove redundant buttons, internal keyword tags, excessive spacing, and unnecessary subtext.
4. **Content updates:** Update TKR steps and revise the VR Dep report structure.
5. **Performance:** Reduce repeated loading and improve navigation responsiveness.

**Overall goal:** Make Learner Mode compact, intuitive, and consistent, with a clear progression from selecting a procedure to working on a case, planning, completing sessions, and reviewing reports.
